1. Introduction

1.1 Purpose

The purpose of this document is to collect, analyze, and define the high-level needs and features of the Mini-StackOverflow system. It focuses on the capabilities required by Regular Users and Moderators to ensure a collaborative and safe environment.

1.2 Scope

The scope of this Vision document is to describe the primary objectives of the project. This project focuses on the development of a client-server application designed to facilitate a structured community for knowledge exchange. It encompasses user interaction (posting, voting, editing) and administrative tools (suspension, log exports, content moderation).

1.3 Definitions, Acronyms, and Abbreviations

- JSON: JavaScript Object Notation; used for exporting activity logs.
- Moderator: A privileged user responsible for maintaining forum integrity.
- Flagged Post: A post reported by the system or users as potentially inappropriate.

1.4 References

- Use Case Model: This specification contains the textual properties and UML diagrams for the system's primary functions.
- Glossary: This document provides the definitions of all terms, acronyms, and abbreviations required to properly interpret the technical language used throughout the project.
- Supplementary Specification: This document captures the system requirements not found in the use cases, including quality attributes like performance and security.

1.5 Overview

This document outlines the business opportunity for a technical forum, defines the problem of unorganized knowledge sharing, identifies key stakeholders, and details the functional requirements for both Regular Users and Moderators.

2. Positioning

2.1 Business Opportunity

There is a growing demand for specialized, high-quality technical communities. By providing a structured environment for Q&A with peer voting, Mini-StackOverflow fills a gap for organizations and niche groups requiring managed knowledge bases.

2.2 Problem Statement

The problem of	Fragmented or unverified technical information in large, unmanaged communities.
affects	Developers, students, and technical enthusiasts seeking reliable answers.
the impact of which is	Decreased productivity, potential for incorrect solutions, and lack of community accountability.
a successful solution would be	A centralized, moderated forum where quality content is promoted via voting.

2.3 Product Position Statement

For	Technical communities and organizations.
Who	Need a structured way to ask questions and archive solutions.
The Mini-StackOverflow	Is a client-server forum application.
That	enables users to post questions/answers while empowering moderators to maintain content quality.
Unlike	Generic social media or basic chat applications.
Our product	offers specific moderation tools like user suspension and JSON activity log exports for transparency.

3. Stakeholder and User Descriptions

3.1 Stakeholder Summary

Name	Description	Responsibilities
Project Sponsor	Individual or company funding the development.	Approves the final feature set and ensures project alignment with business goals.
System Administrator	Technical lead for the server infrastructure.	Ensures system uptime, database integrity, and security of stored data.

3.2 User Summary

Name	Description	Responsibilities	Stakeholder
Regular User	Community participant.	Create questions, post answers, vote on posts, edit own posts, and search questions.	Community.
Moderator	Content overseer.	Delete inappropriate posts, suspend users, edit categories, approve flagged posts, and export logs.	System Admin.

3.3 User Environment

The application will operate in a standard web or desktop environment where users have internet/network access to a central server. Data must be stored in a centralized database to ensure all users see synchronized content in real-time.

4. Product Requirements

- Architecture: Must follow a strict client-server model.
- Database: All forum data, user roles, and logs must be stored in a persistent database.
- Performance: Search functionality must provide low-latency results across the question database.
- Hardware: Centralized server with sufficient storage for the post database.
